

Claude interface showing a chat session titled "Vibe Coding tools for debugging and feature development". The chat history on the left includes pinned items like "BAHF website and other things", "Schneider Hackathon", "ilt study - purav", "SE PROJECT(PRANAVI)", "kotlin", "DBMS Project", "SIH", and "Capstone".

The main chat area displays the following steps to finish the lab:

- Before video:** Run the *original* repo (`pip install pygame`, then `python main.py`) and record about 10 seconds. Include a few fast swipes through fruit that don't register, and the game ending with nothing on screen. Windows: Win+Alt+R (Xbox Game Bar); Mac: Cmd+Shift+5.
- After video:** Unzip `Lab-4`, run it, and record about 10 seconds showing fast swipes working, slice sounds, hitting a bomb, and the game-over screen with a replay.
- Push to your own lab repo** (not SETAPESU26):

```
bash
cd your-lab-repo
# copy the Lab-4 folder in, plus before.mp4, after.mp4, chat.pdf
git add Lab-4
git commit -m "Lab 4: Fruit Ninja fixes and features"
git push
```

Step 4: **Chat history:** Open this chat, press Ctrl+P / Cmd+P, and choose "Save as PDF". You can also use the share link, since the README exists for that. Put the file in `Lab-4/`.

The chat input field shows "Write a message...". The status bar at the bottom indicates "Claude is AI and can make mistakes. Please double-check responses." and "Opus 5.5 Medium".

The same Claude interface, but now displaying a list of downloadable files for the lab:

- Lab 4 ZIP [Download]
- Game engine PY [Download]
- Fruit PY [Download]
- Sounds PY [Download]
- Main PY [Download]

A "Download all" button is located below the file list. The chat input field and status bar remain the same as in the previous screenshot.

Vibe Coding tools for debugging and feature development

Step 4: Get the fixed code and record the "after" video

- Download **Lab-4.zip** from my previous message and save it into **C:\SE-Lab4**.
- Right-click it, choose **Extract All**, and extract to **C:\SE-Lab4**. Check that you end up with **C:\SE-Lab4\Lab-4\main.py**. If you get **Lab-4\Lab-4\main.py**, move the inner folder up one level.
- In Command Prompt, run:

```
cd C:\SE-Lab4\Lab-4
python main.py
```

- Record about 10 seconds the same way as before. Show fast swipes working (with sound), then slice a bomb or lose all lives, show the Game Over screen, and press 1, 2, or 3 to replay.
- Rename that video to **after.mp4**.

Step 5: Export this chat as a PDF

- In this Claude chat, scroll all the way to the bottom so the whole conversation is loaded.
- Press **Ctrl + P**, set the destination to **Save as PDF**, and save it as **chat_history.pdf**.

Write a message...

Claude is AI and can make mistakes. Please double-check responses.

Opus 5.5 Medium

Step 6: Clone your own Lab repo

If you don't have one yet, go to github.com, click + (top right), choose **New repository**, give it a name (e.g. **SE-Lab**), tick "Add a README", and click **Create**.

Copy your repo's URL from the green **Code** button, then run:

```
cd C:\SE-Lab4
git clone https://github.com/YOUR-USERNAME/YOUR-LAB-REPO
```

Step 7: Put everything in a Lab-4 folder inside your repo

In File Explorer:

- Copy the whole **C:\SE-Lab4\Lab-4** folder into **C:\SE-Lab4\YOUR-LAB-REPO**.
- Put **before.mp4**, **after.mp4**, and **chat_history.pdf** inside that **Lab-4** folder.

Step 8: Push to GitHub

```
cd C:\SE-Lab4\YOUR-LAB-REPO
git config --global user.name "Your Name"
git config --global user.email "your-github-email@example.com"
git add Lab-4
git commit -m "Lab 4: Fruit Ninja fixes and new features"
git push
```

The first time you push, a browser window pops up asking you to sign in to GitHub. Sign in and the push will finish. You only need the two `git config` lines once per computer.

Step 9: Verify

Open your repo on [github.com](#) and check that the `Lab-4` folder has the code, both videos, and the PDF. Don't open a pull request to SETAPESU26.

If any command gives an error, paste it here and I'll tell you what to do.

C:\Users\purav\OneDrive\Desktop>python 347d7_e68-b801-4dc9-88d7-d622bcda43b0\pygame Collecting pygame
me Downloading pygame-2.6.0.tar.gz (14.3 MB) ...
PASTED

this error in step 2

Diagnosing a pygame install failure on a newer Python.

You're on Python 3.14, which is newer than the regular `pygame` package supports. pip couldn't find a ready-made version for 3.14, so it tried to build pygame from source and failed.

The easy fix is `pygame-ce`, the community edition of pygame. It already supports Python 3.14, and it's a drop-in replacement: the code still says `import pygame` and needs no changes.

In the same Command Prompt window, run:

Opus 5.5 Medium

Claude interface showing a chat session titled "Vibe Coding tools for debugging and feature development". The chat content includes:

The easy fix is **pygame-ce**, the community edition of pygame. It already supports Python 3.14, and it's a drop-in replacement: the code still says `import pygame` and needs no changes.

In the same Command Prompt window, run:

```
pip uninstall pygame
pip install pygame-ce
python main.py
```

If the uninstall says pygame isn't installed, that's fine; carry on with the next line.

If **pygame-ce** also fails, install Python 3.12 alongside 3.14:

1. Download Python 3.12 from python.org/downloads/windows (pick a 3.12.x "Windows installer (64-bit)").
2. Run the installer and tick "Add to PATH".
3. Use the `py -3.12` launcher to install and run with that version:

```
py -3.12 -m pip install pygame
py -3.12 main.py
```

Write a message...

Claude is AI and can make mistakes. Please double-check responses. Opus 5.5 Medium

Continuation of the Claude chat session:

1. Download Python 3.12 from python.org/downloads/windows (pick a 3.12.x "Windows installer (64-bit)").
2. Run the installer and tick "Add to PATH".
3. Use the `py -3.12` launcher to install and run with that version:

```
py -3.12 -m pip install pygame
py -3.12 main.py
```

4. Use `py -3.12 main.py` instead of `python main.py` in Step 4 as well.

The rest of the steps don't change. Once the game window opens, continue with Step 3 (the "before" video).
